

The signals to help WCO sellers win deals and hold owned-brand margin.

A read-only, vendor-side intelligence and activity platform inside WCO. It surfaces the signals and tracks our engagement, so the Owned Brands team shows up at the right time with the right pitch.

surface signal → reach the right seller → win & hold margin → growth

We can't see the signals that win deals and hold margin

We're the vendor team

The Owned Brands team is WCO's owned-brands vendor team. Our job is to call on WCO sellers and select customers and help them win.

We fly blind

We don't see which sellers are about to lose a winnable deal, or where competitive pressure is eroding owned-brand margin.

We have no tools of our own

WCO's distributor systems weren't built for the vendor lens. OB-specific tools would lift win rate and margin organization-wide.

The platform's job: surface those signals and put us in the right place at the right time.

Our own systems are blind to the vendor lens

Distributor lens: CORE & USD

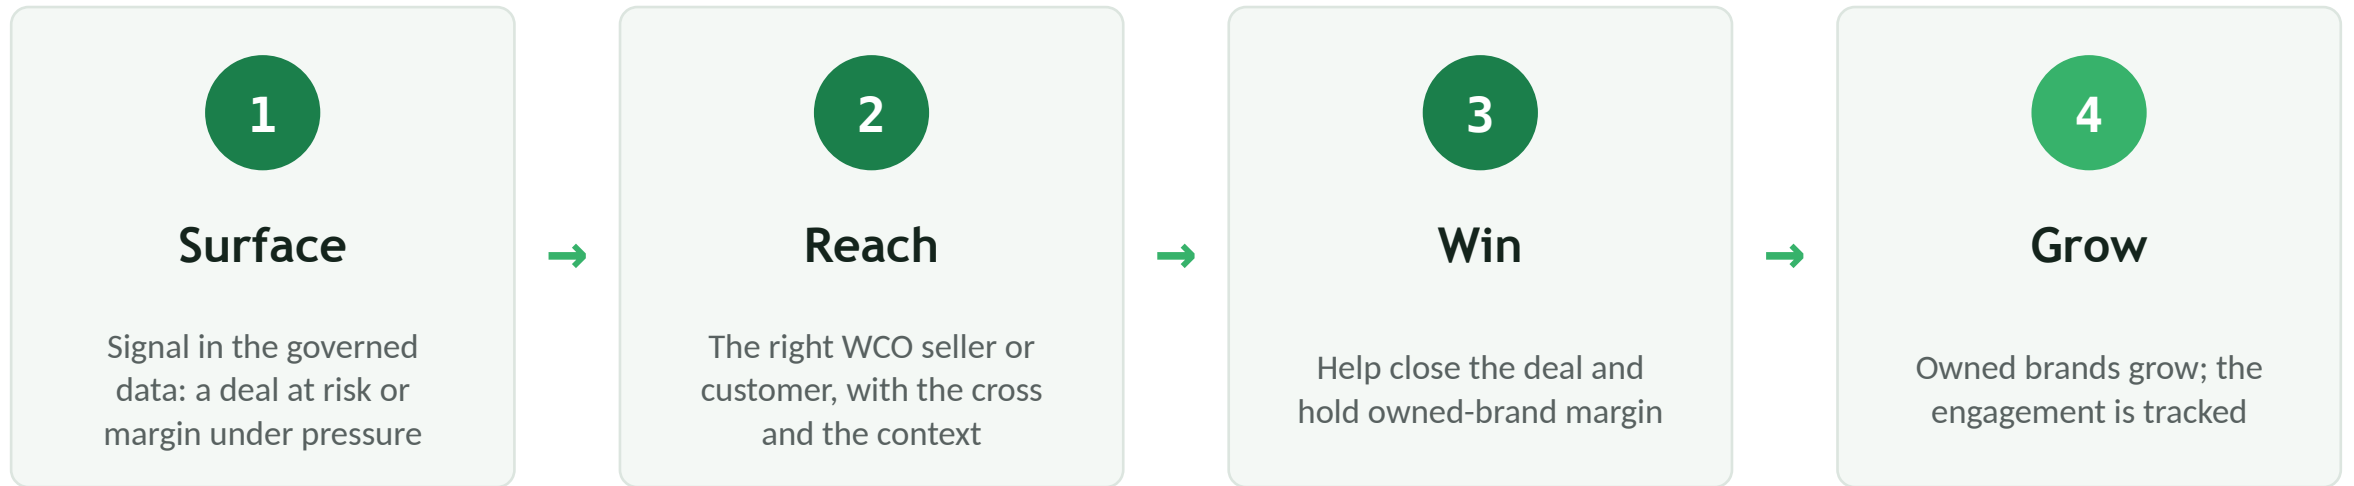

- Built for the distributor operating model
- Order, invoice, and channel transactions
- No view of brand sell-through or competitive conversion
- No vendor-side activity tracking

Vendor lens: what Owned Brands needs

- Competitor sell-through, brand by brand
- Margin performance on every line
- SKU cross-reference to owned-brand equivalents
- Engagement with WCO sellers (our customer; not in USD)

Without the vendor lens, the signal lives in disconnected spreadsheets, invisible to leadership and impossible to scale.

One loop puts us in the right deal at the right time

The SKU is the spine. One detail view unifies sales, stock, opportunities, crosses, and activity. Two tiers run the model: the WCO seller channel (push) and WCO customers (pull).

A vendor-side platform and CRM, already prototyped

Cross database

Competitive product → owned-brand mapping. OB enablement, not org-wide access.

Signals + supply

Where to show up: deals at risk, margin under pressure, stock signal.

Vendor-lens CRM

OB-generated opportunities; engagement with WCO sellers, our customer (not in USD).

AI email-drop

A note → records; opportunity-loss and product-development signals.

Leadership dashboard

Natural-language query over the whole pipeline.

Inventory & forecast

Stock overlay with pipeline-weighted demand.

A working two-persona prototype (Leadership + Sales Team) already exists: proven UX, not a concept.

Read-only and in-tenant: zero risk to CORE or USD

What we will NOT do

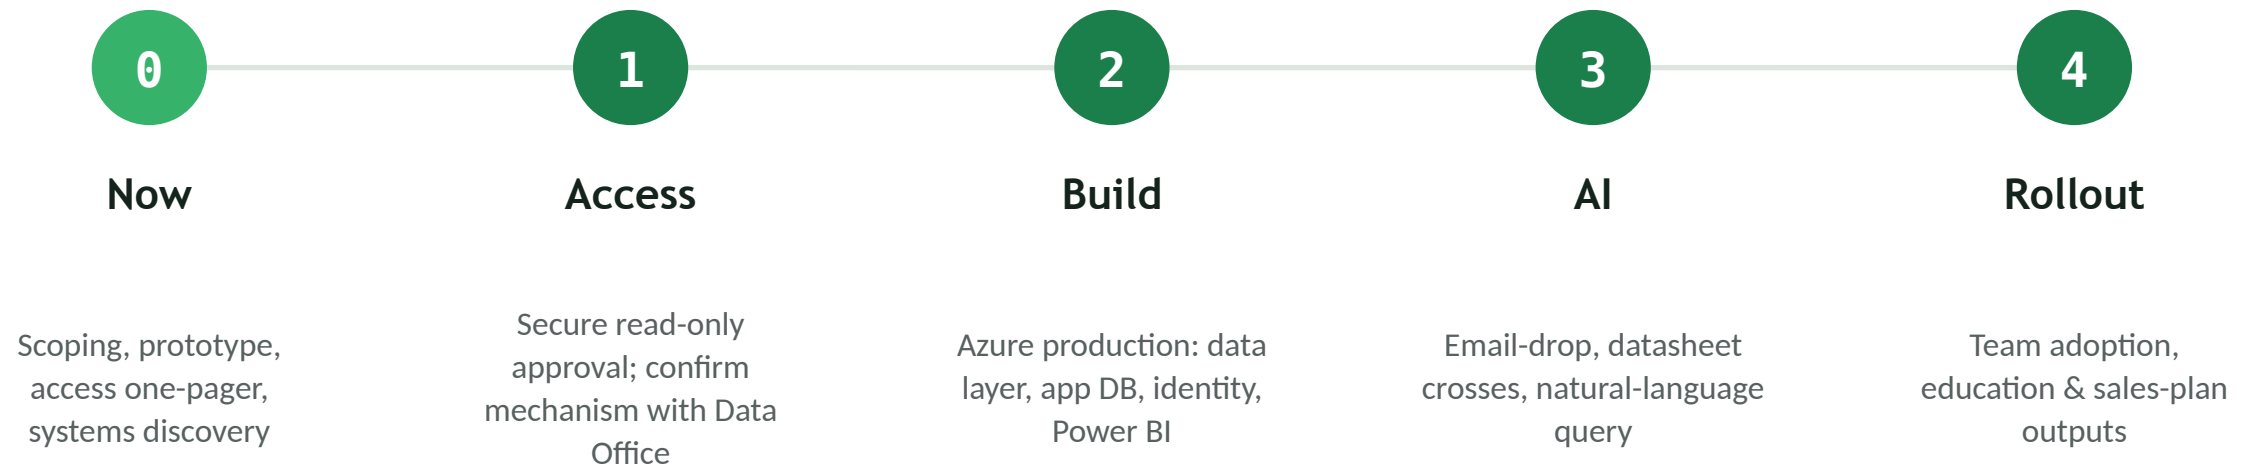

- ✗ No write / update / delete to CORE, USD, or any system of record
- ✗ No direct production-database connectivity
- ✗ No duplication or ownership of WCO data
- ✗ No access outside the OB sales team
- ✗ No data egress outside the Microsoft / Azure boundary

How it's governed

- ✓ Azure-native: App Service / Functions + isolated Azure SQL
- ✓ Entra ID SSO, application RBAC, territory row-level security
- ✓ Embedded certified Power BI, no dataset duplication
- ✓ Azure OpenAI in-tenant; margin/cost handled as Confidential

This complements Power BI and introduces no new system of record for WCO data.

A phased build I can execute solo

Phased by design: each phase is independently valuable and lowers the risk of the next.

THE ASK

Approve read-only access, an Azure environment, and governance liaisons

1

Read-only data access

Governed WCO sales data incl. margin/cost, via certified datasets, Power BI, or the API layer.
User group: the Owned Brands sales team only, no access outside OB.

2

Azure build environment

Subscription / resource group under WCO governance, Entra ID app registration, Azure OpenAI in-tenant, and a Power BI workspace with certified-dataset read access.

3

Governance liaisons

Named contacts from Data Office, BI Governance, Cloud Engineering, and IT Security, plus confirmation of the access-request workflow and margin/cost classification.

Not requested: writes to CORE/USD, direct DB connectivity, data duplication, access outside OB, or any egress.

Approve these and the Owned Brands team can finally see the signals and act on them.
