

Turn competitor sell-through into higher-margin owned-brand revenue.

A vendor-side sales-intelligence and CRM platform inside OBCO — read-only from governed OBCO data, owning only Owned Brands activity.

identify sell-through → cross to owned brand → quantify margin lift → rep converts

Every competitor part our customers buy is owned-brand margin we can't see

Higher margin, same shelf

Owned-brand product carries materially higher margin than the competitor lines our customers buy today.

Every customer is a target

Any OBCO customer buying competitor product we can cross is a conversion opportunity — not just OB_Vend AV.

Sized once we can see it

Total addressable lift is quantified with the Data Office the moment sell-through access is granted.

The platform's job: find that sell-through at scale and route it to a rep.

Our own systems are blind to the vendor lens

Distributor lens — CORE & USD

- Built for the distributor operating model
- Order, invoice, and channel transactions
- No view of brand sell-through or competitive conversion
- No vendor-side activity tracking

Vendor lens — what Owned Brands needs

- Competitor sell-through, brand by brand
- Margin performance on every line
- SKU cross-reference to owned-brand equivalents
- Opportunities, quotes, and engagements tracked

Today the conversion pipeline lives in disconnected spreadsheets — invisible to leadership and impossible to scale.

One loop converts competitor sell-through into margin

The SKU is the spine — one detail view unifies sales, stock, opportunities, crosses, and activity. Two tiers run the model: the OBCO seller channel (enablement) and the end customer (demand).

A vendor-side platform and CRM — already prototyped

Cross-reference engine

Competitor → owned-brand part mapping; living, searchable.

Conversion + supply

Targets ranked by margin upside, paired with a stock signal.

Vendor-lens CRM

Opportunities, quotes, calls, demos, hardware evals.

AI email-drop

Rep emails a note → structured records; datasheet cross-extraction.

Leadership dashboard

Natural-language query over the whole pipeline.

Inventory & forecast

Stock overlay with pipeline-weighted demand.

A working two-persona prototype (Leadership + Sales Team) already exists — this is proven UX, not a concept.

Read-only and in-tenant — zero risk to CORE or USD

What we will NOT do

- ✗ No write / update / delete to CORE, USD, or any system of record
- ✗ No direct production-database connectivity
- ✗ No duplication or ownership of OBCO data
- ✗ No data egress outside the Microsoft / Azure boundary

How it's governed

- ✓ Azure-native: App Service / Functions + isolated Azure SQL
- ✓ Entra ID SSO, application RBAC, territory row-level security
- ✓ Embedded certified Power BI — no dataset duplication
- ✓ Azure OpenAI in-tenant; margin/cost handled as Confidential

This complements Power BI and introduces no new system of record for OBCO data.

A phased build I can execute solo

Phased by design: each phase is independently valuable and lowers the risk of the next.

THE ASK

Approve read-only access, an Azure environment, and governance liaisons

1

Read-only data access

Governed OBCO sales data incl. margin/cost — via certified datasets, Power BI, or the API layer. Defined Owned Brands user group; sole user at launch, expandable.

2

Azure build environment

Subscription / resource group under OBCO governance, Entra ID app registration, Azure OpenAI in-tenant, and a Power BI workspace with certified-dataset read access.

3

Governance liaisons

Named contacts from Data Office, BI Governance, Cloud Engineering, and IT Security — plus confirmation of the access-request workflow and margin/cost classification.

Not requested: writes to CORE/USD, direct DB connectivity, data duplication, or any egress.

Approve these and Owned Brands starts converting competitor sell-through into margin.
